Abstract

Many government institutions worldwide have shifted their digital services to a more advanced transformation through the implementation of smart government. Digital identity is perceived as the key to maximizing the service delivery of smart government to citizens. Even though the government has aggressively transformed traditional identification with electronic identification in Indonesia since 2011, the national digital identity has recently been initiated. The Indonesian government has made significant efforts aimed to succeed in the initiative. However, the discussion regarding the governance of digital identity has not been sufficiently addressed. Learning from other developed countries that have successfully harnessed the integration of digital identity and smart cities, many issues, primarily ethical concerns, need to be tackled. In addition, there is limited research investigating the ethical issues of digital identity in developing countries where society is characterized by a considerable gap in human capital, literacy, economy, and other social factors. Indonesia is a country where the digital divide is still widely apparent. This paper highlights ethical issues concerning integrating digital identity with smart government and explores how government should govern the digital identity to create a safe, trusted, and inclusive smart government. As most of the literature on digital identity discusses its technical arrangements, this study enriches the existing literature on digital identity by presenting the ethical issues behind the implementation of digital identity in a developing country and the governance mechanism that the government should consider.
